

What exactly did we remove?

Same tree and focus: `Node(1, Node(2, Tip, Tip), Tip)`

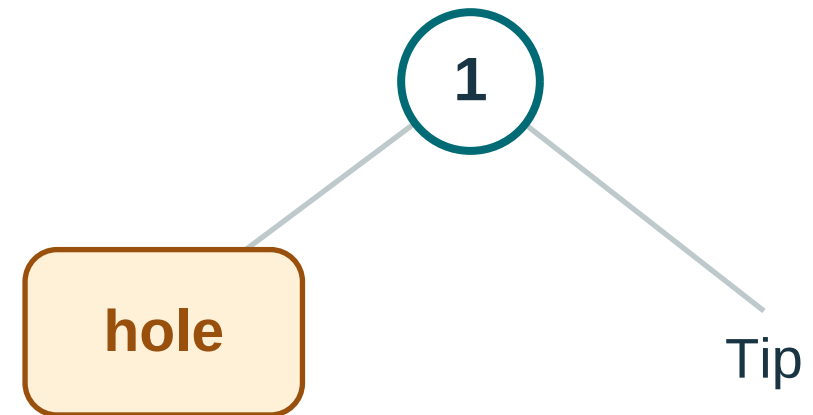

Element hole

Remove only 2; keep both children.

Fill with an element value.

Subtree hole

Remove the whole `Node(2, Tip, Tip)`.
Its children leave with it.

Fill with any tree, including Tip.

In both panels, the path remembers parent 1 and the untouched right Tip.

An element context also keeps the two children at the focused node.
